

How to Print an image from MapSifter:

Note: MapSifter does not have an embedded printing functionality. The best way to print or save an image is to do a PrintScreen operation and then paste it in another document.

Directions for PrintScreen:

1. First, Navigate to the location/parcel you are interested in.

(Optionally) Use the mouse to single left-click on a Parcel in the map. This highlights the boundary in yellow and produces a content window showing the Parcel ID and owner name.
2. Next, use the PrintScreen key to capture the image.
 - a. How to use the PrintScreen key:
 - i. Pressing **Alt + PrintScreen** keys simultaneously captures an image of only the active program window on your screen. (Recommended)
 - ii. Pressing only the **PrintScreen** key captures the entire monitor display.
 - b. You may not see anything happen but the image has been captured in memory.
 - c. (Optionally) Some computers have print screen software loaded that immediately displays the captured image.

3. Next, open any program that allows you to paste an image (e.g. Word, PowerPoint, etc)
4. Right-click in the opened program window and select **Paste**
OR
Press **Ctrl + V** (this is the shortcut for Paste)
5. You can now resize, edit,crop, print, and/or save the document.
